

Emergency Changes

Emergency Changes should be used to resolve a current incident **or** to prevent an incident from occurring. Emergency Change Requests (ECRs) may be entered either before or after the change. The best practice is to utilize the following guidance:

- If you have an active Severity 1 or Severity 2 outage, then you should implement the change and document the ECR immediately after the change has been validated to remediate the outage.
- If you must immediately take action to prevent an outage you should also implement the change first and document the ECR immediately after you have confirmed that you have avoided the outage.
- If you have some time to schedule the implementation without posing additional risk of the incident evolving to an outage you should process the ECR, including the Peer Review, prior to implementing the change.

When implementing an Emergency CR make sure to run it by a peer or a second set of eyes to minimize the chance of unanticipated consequences.

In all cases, it is requested that you ensure that your manager is aware of any ECRs being processed.
