

Standard Changes

Standard Change Eligibility:

- Implementation at least once or more per month
- Only Low Risk Changes are eligible, run 4 times in a row without errors/issues
- All security vulnerabilities need to be resolved for any PCI related change
- Sonarqube scans should be using the Alaska Standard (70% coverage rate) or higher
- Can be used to monthly patching events or runs of pipeline deployments

During the soft change freeze, there are no additional authorization requirements; you can implement your standard during the times authorized in your approved standardized change.

If you would like to nominate a Normal successful closed CR for a Standard CR you can select "Nominate for Standard" on the left-hand side of your CR form, this should be done by the Monday 5pm cutoff. It will be reviewed to ensure that it meets the requirements for a standard change at the next CAB Meeting. All supporting paperwork should be completed and attached to the CR nominated for Standard Change by Thursday at 1pm. These will be reviewed on that Thursday 2pm meeting.

Standard CRs are authorized on an annual basis, the GUID assigned to the Standard Change will expire within 1 year.

For Standard Change renewals:

- Only a normal change can be renominated, you can not nominate a standard change for another standard change.
- If your pipeline has changed, additional steps are added, you will need to create a new normal change to nominate for the next renewal.
- Multiple pipelines are not allowed on one standard change, they need to be separated out into separate Change Requests.
- If you renominate an older normal change to be your standard change, make sure all links are functional. If you see this on clicking a link in your implementation plan,

then you will need to start with a new normal change to first close and then nominate as your standard change:

Note that for SonarQube - quality gate of Alaska Standard or higher must be used:

A screenshot of the SonarQube web interface showing the "Quality Gates" configuration page. The left sidebar lists various quality gates, with "3_Alaska Standard" highlighted in blue and labeled "DEFAULT". A red rectangle is drawn around this entry. The right panel shows the configuration for "3_Alaska Standard", including a list of metrics such as "Security Hotspots Reviewed", "Coverage", "Duplicated Lines (%)", "Maintainability Rating", "Reliability Rating", and "Security Rating".
